Sir James Dyson donates £19m for education centre at his former school

Sir James Dyson, the inventor of the bagless vacuum cleaner, has donated £19m to a school in Singapore, which he has been attending since he was a child. The donation will establish a new education centre, named the Dyson Foundation Education Centre (DFEC), at the Singapore American School (SAS). The DFEC will be used for a range of educational activities, including science and technology workshops, and will provide students with access to state-of-the-art facilities. The centre will be located in a renovated building on the school's campus and will be open to both students and the wider community. The donation will support the school's goal of providing a world-class education for all its students, and will help to build a strong foundation for the next generation of leaders.
